

Milestone 1:

- Wanted to create application that connects users to various parts of the world based on personality and interests
- Use java to create application
- Focus on MVP and then expand on it

Milestone 3:

- MVP 1: three preference selections, different location recommendations, location details, restart button
- Simple, clean, and easy to use interface

Future Milestones:

- More preference selections, interactive destination map, integrate more web features
- Could implement web scraping for location details

Milestone 2:

- application that recommends locations to users based on specified preferences (more specific vision)
- Use HTML, CSS and PHP to create application
- Diagrams and application structure planned out

Milestone 4:

- MVP 2: back button, links to websites with more info, activity suggestions, user input on recommendations
- Improved interface

Success? We think so!

Highlights:

- Actually getting the application to work!
- Successfully designing a clean and pleasing interface
- Successfully mapping the users' choices to unique locations
- Providing quite a few details about the locations

"Better-Ifs":

- There were more preferences that users could enter to affect the location recommendation
- Location details don't have to be found and entered into the database manually
